Abstract (en)

[origin: EP1304426A2] The invention is a new support for raised floors with adjustable height, comprising a cylindrical base element, threaded on the inside, for resting on the laying surface, an intermediate element or extension, threaded at top and bottom, and a top element with a concave top housing a swinging cap with diaphragms, on which the flat elements of the raised floor rest. This new support makes it possible to construct perfectly flat and continuous raised floors even in presence of considerable differences in level or slopes of the laying surface. <IMAGE>
