Abstract (en)

[origin: EP1304817A2] The mobile communication system for communications between a base station and a mobile station, employing a TDD method, sets up transmission power of the base station for each of downlink time slots that are to be transmitted next, based on receiving quality of downlink time slots that have been received by the mobile station immediately prior to transmitting the next time slots, and based on receiving power level of uplink time slots that are received by the base station. <IMAGE>
