Abstract (en)

[origin: WO211375A1] The invention relates to a method for linking networks of different modes of transmission. Inside the network, data is transmitted in a circuit-switched manner. Inside the network, the data is transmitted in a packet-switched manner and is transmitted in a connectionless manner on the lower three protocol levels. In order to be able to easily carry out signaling, signaling units are used, which process signaling messages of the circuit-switched network. The circuit-switched network (12) is preferably an ISDN. The packet-switched network is preferably the internet.
