Abstract (en)
[origin: WO0211458A1] The invention relates to a method according to which a signaling unit (10) contains at least two connection units (20, 22) that are used for setting up a connection for transmitting useful data in data packets. The connection units (20, 22) each terminate the signaling to one of the terminals involved in the data transmission. The connection units exchange internal signaling messages among one another. This enables the signaling to be carried out in a simple manner.
