Abstract (en)

[origin: WO0213241A2] The present disclosure pertains to a method of plasma etching a titanium nitride layer within a semiconductor structure. In many embodiments of the method, the titanium nitride layer is etched using a source gas comprising chlorine and a fluorocarbon. Also disclosed herein is a two-step method of plasma etching a titanium nitride gate consisting of a main etch step, followed by an overetch step which utilizes a source gas comprising chlorine and a bromine-containing compound, to etch a portion of the titanium nitride layer which was not etched in the main etch step. The chlorine/bromine overetch chemistry can be used in conjunction with a chlorine/fluorocarbon main etch chemistry, or with any other titanium nitride etch chemistry known in the art.
