Abstract (en)

[origin: EP1308415A2] At the beginning of the load lowering operation the hydraulic pressure prevailing in the lift cylinder (12) is built up both in the section (L2.3) of the return line located upstream of the hydraulic pump (P) and the section (L1.2) downstream of it, whereby the pump is operated at an actual RPM which lies below a RPM threshold value and a proportional pressure relief valve (PDBV) in the return line downstream of the pump is fully opened via a ramp function if the actual RPM of the pump lies above the threshold value, whereby the electric motor (M) of the pump then operates as a generator. <??>An Independent claim is included for a hydraulic system for executing the proposed method of controlling a hydraulic lifting device.
