Abstract (en)
[origin: WO0214099A1] The invention relates to a gear shift (22) for operating an automated transmission (11, 12) for a motor vehicle which comprises a disengagement arrangement (12) positioned in the drive line between the engine (10) and the gearbox (11) of the vehicle. The gearbox can be operated between a neutral position and at least one drive position by operating the gear shift between a corresponding neutral position (N) and at least one corresponding drive position (D). In order to make possible rapid operation of the gearbox, a detector is arranged so as to detect an actuation of the gear shift (22), which detector is connected to operating means (17, 18) for activating the disengagement arrangement (12).
