Abstract (en)

[origin: WO0214634A1] The invention relates to a novel safety device for a locking device that is actuated manually using an actuating element and is used for doors and/or windows. The invention is characterised in that the safety device only permits the actuation of the locking device, if a force equal to or greater than a pre-defined actuation force is exerted on the actuation element (2, 2a, 29, 52). Said actuation force can be set in such a way that it cannot be exerted by a child. The safety device is designed to be activated and deactivated.
