Abstract (en)

[origin: WO0213340A2] The invention relates to a method and device for determining the output power of a semiconductor laser diode, which is operated with a diode current (I_d). According to the invention, a defined measuring current (I_m), which is less than the threshold current of the semiconductor laser diode (HLD) is conducted in a conducting direction through the semiconductor laser diode (HLD). The forward voltage (U_f) decreasing over the semiconductor laser diode (HLD) is measured, and the temperature of the laser-active region of the semiconductor laser diode (HLD) is determined from the measured forward voltage (U_f) by using at least one calibration curve. The invention makes a simple and precise determination of the output voltage possible without requiring an additional measuring device, for example, a monitor diode.
