Abstract (en)  
[origin: EP1310929A2] Pane element comprises at least one pre-tensioned glass pane having on its surface an electrical conductor structure with electrical connection lines leading to the edge of the glass pane. The glass pane is a component of an insulating glass element consisting of at least one further pane and a frame-like spacer. The spacer is connected by an adhesive strip to the surface of the glass pane provided with the conductor structure and crosses the electrical connections in the region insulated with a thin, insulating, protective layer. In the crossing region on a pre-determined path the adhesive strip consists of a material having a higher electrical insulating activity than the rest of the adhesive strip. Independent claims are also included for processes for producing the above pane element. Preferred Features: At least one further thin, insulating, protective layer made of an electrically non-conducting material is provided between the connections and the spacer, especially between the connections and the adhesive strip.
