Abstract (en)

[origin: WO0203658A2] The stations connected to the network include dedicated servers managing respective services. The intermediation device comprises means service integrating means (421) and interface means (410, 426, 430) between the service integrating means and the stations. The service integrating means comprise a storage unit (424) wherein are recorded scripts defining additional services whereof the execution includes invocation of services managed by the dedicated servers, and control means (423) co-operating with the script storage to execute additional services in response to messages coming from some at least of the stations.
