Abstract (en)

[origin: WO0215598A1] The invention provides a communication system comprising at least one terminal network element which can be connected to other network element(s) located in the same or another network. The system is adapted to allow an activation of at least one service, e.g. location service, for the at least one terminal network element, the service being executable based on service logic. The terminal network element(s) comprises or implements a standardised terminal environment for executing at least part of the service logic. Further, a standardised network application programming interface is provided for accessing at least one of the services. A broker cooperates with or has access to the standardised network application programming interface and the services. Thus, an infrastructure is provided which enables services to roam with a user. The customers can therefore roam from one network to another network (hybrid network) and will still keep the same services across these different networks.
