Abstract (en)

[origin: WO0217662A1] According to the inventive method for controlling access in a radio communications system, several subscriber stations (MS1, MS2) transmit a respective access sequence (s1,s3) to a base station (BS) of the radio communications system on a channel for random access (RACH). Afterwards, the radio communications system confirms reception of the access sequences (s1,s3) on another channel (FPACH) by means of a message, whereby, in the message, a subscriber station (MS1) is selected, which can subsequently transmit additional sequences to the base station (BS) on a physical access channel (PRACH).
