Abstract (en)

The purpose of this Patent is a "Modular element for shaping balustrades", the use of which is explained in the title of the invention. The element, coupled to another equal one, simultaneously operates as a loading base between two adjacent balustrades and as a lost formwork for the handrail and is made up of a rectangular plate. On one of the ends of its upper face it has an orthogonal rim (1) and the edges (2) folded upwards and inwards; a central casting (3) with the edges (4) folded in the same way but with more separation than the edges (2) of the first third; and a serie of grooves (5) parallel to the smaller side. Its lower face has an orthogonal rim (6) on its smaller side, underneath the handle (1), which is embedded in the suitable groove (5) to attach the balustrades at the chosen distance. <IMAGE> <IMAGE>
