Abstract (en)

[origin: WO0169003A1] The invention relates to a device for holding the edge zone of a foil (10) on a wall section (1). The inventive device has a hollow space (22) that is designed as a profile (20), is essentially U-shaped, serves for receiving the edge zone and is provided with means (23) which hamper a movement of the edge zone away from the hollow space (22). The profile (20) is provided with bearing surfaces (28, 29) which are essentially opposite one another and can optionally be brought to rest on the wall section, especially according to the composition of the wall section (1).
