Abstract (en)

[origin: WO0212662A1] The invention relates to a door fitting which is adapted for mounting the handle and the support on opposite sides of the exterior paneling of a door. The support comprises a bearing axle. Between the support and the handle two knee levers are disposed which consist of lever arms that can be coupled pair-wise, namely a handle arm on both handle ends and a bearing arm on both support ends. The bearing arms are configured as a pre-assembly together with the bearing axle and the support. The handle arms are inserted through two openings in the exterior paneling of the door and are linked with the bearing arms via coupling means, a screw securing the engaged position. The aim of the invention is to make assembly of such a door fitting easier. To this end, the back knee lever is provided with members which can be inserted one into the other and whose inserted position is secured by the screw. The counter-member is provided with a pocket into which the securing screw engages for the purpose of securing. Said securing screw further retains the spring-loaded bearing arms in a defined pre-assembly position vis-à-vis the support, thereby facilitating the coupling of the insertable members and counter-members.
