Abstract (en)  
[origin: WO0216796A1] The invention concerns a spring (4) comprising two branches (41, 42) linked by a bend (40) such that the branches form, in neutral position, an acute angle, said branches being elastically deformable relative to each other in a pivoting movement about the bend. The invention is characterised in that it comprises an accumulation of energy (43, 44) providing the spring with initial resistance to deformation with a resistance threshold to be overcome to continue bringing sharply together the two branches.
