Abstract (en)  
[origin: WO0163399A2] The programme that is running on the server continues to run without a connection to the first computer and carries out state changes. As soon as an existing connection has been interrupted, the state of the first computer is stored within the programme that is running on the server. The programme is continued and state changes are logged. The state changes are initiated by the server. Once a new connection has been established, the programmes are synchronised.
