Abstract (en)

A system is provided for automatic feature enablement on the basis of a user's current location, in order to enable the most appropriate set of features. The system is implemented within a tuple space for allowing communication among system components. A location service is provided for tracking the location of a user. Policy daemons are created which contain user specified policies to select appropriate feature sets depending on the user's location. An interface is provided for specifying user preferences for features depending on location. Finally, a basic PBX feature architecture is used which consists of a database to hold individual user feature selections as a set of tuples and a call processing system which uses these feature selections. <IMAGE>
