Abstract (en)
[origin: WO0205676A1] A fastening (10) suitable to connect the ends (101, 102) of an ornamental object developed mainly longitudinally, including a male element (1) and a female element (2) that can be connected removably to one another and each having a body (11, 21) connected to each end of the ornamental object. Said male element (1) has a protuberance projecting from a base element (12) formed by a first pin (13) having at least a transversal projection (14a, 14b) near its free end, said at least one projection being suitable to get in a slit (23) obtained on a foil (22) present on a female element (2), the perimetric outline of said slit (23) being made elastic by means of openings (24, 25) substantially symmetrical about the longitudinal axis of said slit, at least one impression (26, 27) being present in a substantially orthogonal position as to said slit, said at least one impression (26, 27) being suitable to house each transversal projection (14a, 14b) when said at least one projection gets in said slit and rotates as far as housing in said at least one impression.
