Abstract (en)

[origin: US7246475B2] The invention relates to a system for detachably fixing a surface component (16) to a background (18), especially a tile to a wall or on a bottom, whereby projections connected to the surface component when secured to the background and/or recesses engage with recesses connected to the background and/or projections, said recesses and projections being correspondingly embodied in such a way that they have deformable undercuts in the direction of the distance of said component from the background, the projections and recesses connected to the background being embodied on a forming film (4). The projections and recesses embodied on the surface component (4) are formed by a hardenable bonding material (22) which is applied to the forming film (4) joined to the background (18, 26) and/or to the surface component before it is pressed onto the forming film, said material bonding with the surface component when hardened.
