Abstract (en)

[origin: WO0223890A2] The aim of the invention is to produce a network-independent definition and control of services which permits the carrying out of all services on networks connected to the service controller. Said aim is achieved by means of a system, permitting a control of multimedia information and communication services, independent of any aspect of the applied communication network. The service manager unit comprises two basic blocks, the service control unit and the communication control unit. The service manager unit permits the execution of services, requested by a user, by means of various information and communication networks. The networks are selected according to the access for the requested service by a communication control unit. The executing of the service in the service control unit occurs independently of the network selected and the network specific details thereof.
