Abstract (en)
[origin: US2004020316A1] A dual power unit for movement of a back and a footrest in a power-driven armchair comprises an elongated casing (11) which, close to each end, has a transverse-movement shaft (12) which is connected to a shaft (13) of an electric motor reducer through a transmission-gear (15). The transmission-gear comprises a screw (16) connected to the shaft (13) of the motor reducer and extended transversely of the movement shaft (12) and longitudinally of the casing and a threaded sliding slider (17) into which the screw is screwed down. The cam means is integral with the movement shaft and bears on the slider to convert the sliding motion of the slider along the screw into an angular-rotation movement of the movement shaft. The screw (16) thoroughly crosses the slider (17), and the cam means comprises two cam elements (19, 20) laterally projecting from the movement shaft for resting on thrust surfaces (21, 22) provided on the slider on opposite sides of the screw. The contact points between the cams and slider surfaces are disposed on a line meeting the screw axis.
