Abstract (en)

[origin: EP1319629A1] The outrigger consists of telescopic sections (2, 3) one inside the other. There are lubricant distributors (10, 10a) in the head regions of the telescopic sections to supply lubricant to the sliding bearings (7, 7a). In the telescoped state, these lie in a cascade one behind the other. In this condition, lubricant can be passed from one section to another via a system of valves.
