Abstract (en)

[origin: WO0226508A1] The invention concerns a machine for providing a sealed cover for documents comprising a document conveying table (18) with a general longitudinal shape, arranged upstream of a unit for inserting (20) said documents in an envelope (26), at least a contact member (40, 42) mobile longitudinally, under the action of driving means (76, 82, 84, 88) in the direction of the inserting unit and which is designed to drive the documents on the conveying table, the driving means being distant from the inserting unit. The invention is characterised in that said at least one contact member is arranged on a mobile support (44) linked to the driving means in a zone (44b) located upstream of said at least one contact member, the driving means imposing on said at least one contact member a reciprocating translational movement between two extreme positions, in one of said extreme positions said at least one contact member being placed proximate to the inserting unit.
