Abstract (en)
[origin: WO0226853A1] The invention relates to a multicomponent system which can be hardened by means of heat and actinic radiation (Dual Cure). The inventive system contains (A) at least one component comprising at least one constituent which has at least one isocyanate reactive functional group and at least one functional group having at least one bond which can be activated by actinic radiation, in addition to at least one vinylaromatic allyl alcohol copolymer, and (B) at least one component containing at least one polyisocyanate. The invention also relates to the use of said system as coating material, adhesive and sealant.
