Abstract (en)

[origin: EP1321252A2] The stop device for a plate dividing saw involves the plate material (26) to be divided locatable on a stationary side stop (28) on the machine table (10) extending crossways to the dividing plane. The stop device (30) has only one member (32), which in the dividing plane locates on the plate material to be divided. Before a saw cut is effected, it is movable backwards from its engaged position to one of release. <??>The stop member is movably arranged within and along a pressure beam (22) of the plate dividing saw and can be moved out of a lower longitudinal gap of the pressure beam in the dividing plane.
