Abstract (en)

[origin: EP1321411A1] The sheet is passed between a pair of folding rollers (12,14). The folder roller (14) moves in relation to the other, for forming a folding nip. The folding nip width for each pair of folding rollers is detected based on which the movement of folding roller (14) connected kinematically to drive unit, is controlled. <??>An Independent claim is also included for sheet folding machine.
