Abstract (en)  
[origin: WO0229143A1] The invention concerns a device comprising a male member (40) forming a stud screwed on the transmission element (9) and a female member (20) forming a slot fixed on a vertical post (11) of the frame (1). The stud member is formed by an assembly comprising: a nut (41) screwed on the transmission element (9); a catching yoke (45) forming at least two surfaces (51-53) designed to co-operate with contact surfaces (27, 28) of the slot member (20), said yoke being provided with a through bore (46) allowing through the transmission element (9) and receiving rotatably the nut (41); a socket (55) provided with a central bore (56) allowing through the transmission element (9) and means (59, 60) for driving the nut (41) in rotation about the transmission element (9) tightening the socket (55) against the yoke (45) and the nut (41).
