Abstract (en)
[origin: WO0229184A1] The invention relates to a handle that comprises a base (10) that is movably mounted on the door and that interacts with a closure when actuated. On the visible side, the base (10) is covered by a panel (40) that is secured by means of a slide (20) during assembly. Assembly is carried out by hanging the panel (40) into the lower edge zone of the base (10) and folding the panel (40) against the base (10) in the upper edge zone, where a lug provided on the panel (40) penetrates the base to such an extent that it comes to rest on the back of the slide (20) that can be slidingly displaced within the base (10). The base (10) is provided with an opening (34) that allows passage of the lug when the panel (40) is folded against the base. In order to simplify assembly, the slide (20) is preassembled with the base (10) to give one component, in which the slide (20) is captivated in a longitudinal guide (38) by the base (10) and can be slidingly displaced between a protection position and a deprotection position. The slide (20) is provided with a blocking wall (23) and a wall cutout (24, 24') for the lug. In the protection position, the opening (34) in the base (10) is covered by the blocking wall (23) of the slide (20) behind which the lug then engages. In the deprotection position, the wall cutout (24, 24') is brought in one line with the opening (34) by the slide (20) and allows passage of the lug when the panel is folded against the base.
