Abstract (en)

[origin: WO0221317A1] A system for remotely monitoring an individual. The system includes a server system (18) for generating a script program (40) from a set of queries. The script program (40) is executable by a remote apparatus that displays information and/or a set of queries to the individual through a user interface. Responses (42) to the queries that are entered through the user interface together with individual identification information are sent from the remote apparatus (26) to the server system (18) across a communication network. The server system (18) also includes an automated answering service for providing a series of questions from a stored set of questions for an individual at the remote apparatus (26) to respond to, storing responses (42) to each provided question in the series of questions and providing a service based on the individual's response (42) to the questions.
