Abstract (en)

[origin: WO0225750A1] The invention relates to electrodes for organic components, particularly for components such as field effect transistors (OFET's) and/or light-emitting diodes (OLED's), which have conductive and highly resolved finely structured electrode tracks. The electrode and/or conductor track are/is produced by treating a conductive or non-conductive layer comprised of an organic functional polymer with a chemical compound since, at the point of contact, the chemical compound deactivates or activates the layer comprised of an organic functional polymer, i.e. renders it conductive or non-conductive. The non-conductive regions of the layer can be removed.
