Abstract (en)
[origin: WO0225995A1] The aim of the invention is to take account of the dynamics of the area to which a hearing aid is applied, for example the auditory canal. To this end, this area is reproduced in several positions that are adopted by the area as part of its dynamics. With computer assistance (97), these reproductions are then used to optimise the mould or the mould behaviour of the hearing aid shell.
