Abstract (en)

[origin: WO0222820A1] The present invention relates to methods and compositions for the modulation of restenosis and stenosis characterized by constrictive vascular remodeling and neointimal formation, in a subject, by administering a P-selectin antagonist. The invention further provides methods for modulating leukocyte recruitment, cell to cell adhesion, and cell adhesion to blood vessels in a subject by administering soluble P-selectin ligand, an anti-P-selectin ligand antibody, or an anti-P-selectin antibody. The invention also provides methods for identifying compounds capable of modulating restenosis.
