Abstract (en)  
[origin: WO0231255A1] This invention consists of an ironing system comprising an ironing board that receives a series of vibrations. Said vibrations, which have the same effect as the movements of the iron on the cloth, produce heat and thus cause the elimination of the electric resistance, facilitating the ironing work and saving time. The vibrations on the ironing board may be produced by means of different methods, in particular by electromechanical or electromagnetic systems, and their number and intensity is regulated according to the type of cloth to be ironed.
