Abstract (en)

[origin: WO0221289A1] A method and apparatus for adaptive filter graphing in a communication system. The apparatus includes a memory (215) for storing a graphical representation and a communications protocol interface (205) for receiving a message, where the message includes data relating to the graphical representation stored in memory. At least one filter (215) is provided to determine if the data from the received message falls within a range of acceptable data. A multimedia software engine (230) updates the stored graphical representation with the data received in the message providing that the received data falls within the range of acceptable data. The apparatus further includes a display (225) for displaying the updated graphical representation.
