Abstract (en)
[origin: WO0224944A2] The invention relates to a kit for carrying out a method, containing: a) bond sequences immobilised on a support and b) bonds respectively formed from one first primer that is specific to the nucleic acids to be detected and one identification sequence specific to the first primer, whereby the identification sequence is selected from a group of identification sequences that do not cross-hybridise in predetermined uniform hybridisation conditions.
