Abstract (en)
[origin: WO0229339A1] The invention relates to a refrigerating device comprising a refrigerated inner chamber (3) which is enclosed by a heat-insulating housing (1) and which can be closed by a door (2) at the front side thereof, and an air circulation device for sucking in air from the inner chamber (3), guiding the air over a cooling surface and re-ejecting the air cooled in this way into the inner chamber (3) by means of a plurality of ejection openings formed on the inner surface of the housing. At least one air ejection opening (7, 8, 9) releasing an air flow (P2, P3) which is oriented from the inner surface towards the centre of the refrigerating chamber is provided below the plurality of air ejection openings.
