Abstract (en)

[origin: EP1327509A2] The method involves detecting the position of the workpiece packet (4) before the press (3), comparing with a reference position, forming the desired relationship between the packet and press to correct any position errors and feeding the packet into the press with a loading device (1). The packet position is only detected and corrected after its insertion into the press and a real reference marker (7a,7b) on the press is used as a reference position. AN Independent claim is also included for the following: an arrangement for loading a board press.
