Abstract (en)

[origin: EP1327735A2] The high-security closing device comprises a lock which has a stator which carries a plurality of counterpegs, a rotor which carries a plurality of pegs which can be aligned with said counterpegs in an open configuration of said lock and a slot where a key can be housed. The key has at least one pin which can move between a withdrawn position and a protruding position, and the rotor has at least one security peg which collaborates with the pin of the key so that, when the pin is in the protruding position, at least the security peg is in open configuration to allow the rotation of the rotor with respect to the stator. The high-security unlocking procedure of a closing device comprising a lock and a key consists of making a pin come out of a seat of said key pushing it against a security peg of said lock, so as to take said security peg into open position to allow the rotation of a rotor with respect to a stator of said lock. <IMAGE>
