Abstract (en)
[origin: WO0226594A1] The invention relates to a freight container (1) having sides (10, 20) oriented perpendicularly to each other and defining an internal cargo space, and having a rectangular access opening which allows access to said cargo space, said access opening being surrounded by straight sections of a groove (43), said sections being oriented perpendicularly to each other, said groove (43) extending in a plane which is substantially parallel with the access opening, said freight container (1) having separate groove connection devices (50) with a groove (51) which has a cross-sectional shape corresponding to the groove (43), and which forms a continuously extending smooth transition between two adjoining sections of the groove (43). The invention is characterised in that the groove connection devices (50) comprise engagement means that are shaped complementarily to the groove (43) and adapted to provide a mechanical engagement with two adjoining sections of the groove (43).
