Abstract (en)
[origin: US2003183999A1] An apparatus for processing flat objects, such as sheet-like printed products. The apparatus has a rail system which defines a closed path of travel, and a plurality of conveyor elements are supported by the rail system for free and independent movement along the path of travel. The conveyor elements in turn mount product carrier elements. A plurality of stations, including a product feed station, a product processing station, and a product output station, are disposed along the path of travel, and the stations each include a dedicated drive arrangement for the conveyor elements and thus the product carrier elements along the path of travel at a spacing and speed required by the associated station.
