Abstract (en)

The body of the cashbox is structured by means of two casings, one internal (1) and another external (2), between which a cavity (3) is established that houses any means that is considered opportune to prevent the perforation of the wall of the cashbox, like for example metal bands, rods, balls, bars, abrasive elements or others. The access door (8) to the cashbox is provided with an opening system that consists of two mechanisms, one external consisting in a ball lock (4) that acts on a set of bolts (7), and another entirely internal (9) that acts to block the bolts (7) and that is materialised preferably in an electro-mechanism operable by means of validation of an access code. <IMAGE>
