Abstract (en)
[origin: WO0237996A1] The invention relates to a shoe, especially a sports shoe. Said shoe has a sole (1) for receiving one or more studs (5) by means of a moulded body (2) which is arranged on the sole at an angle (alpha) of between 15 DEG and 25 DEG , preferably 18 DEG , to the plane of the sole (S) and which has an opening (3) for receiving a securing device (4) which is located on the stud. Said stud also has a recess which is complementary to the cross-section of the moulded body. The moulded body and the stud are connected by placing the stud on the moulded body and activating the securing device, so that the stud is compulsorily guided into the locking position or out into the unlocking position.
