Abstract (en)

[origin: WO0234095A1] The invention relates to a gas cooker, comprising a burner and gas container (2) (cartridge, gas cylinder). According to the invention, the gas container (2) is thermally conductively connected to a part of the burner (6) that is heated during operation, by a thermally conductive housing (6) of the container holder (5), in order to guarantee the operation of the burner in spite of endothermal gas expansion. The contour of the housing area (10) is adapted to the contour of the gas container (2) in the area of its gas outlet, in order to obtain a large heat-transfer surface.
