Abstract (en)
[origin: WO0237869A2] To set up a multimedia session involving a mobile terminal, a session packet access bearer is established between the mobile terminal and an access point to a packet data network by way of a radio access network. The access point is coupled to a multimedia system that provides multimedia session services. Using the session packet access bearer, a multimedia session involving the mobile terminal is initiated that includes a plurality of media data streams. Media packet access bearers between the mobile terminal and the access point are established. Media binding information is used to associate that multimedia session and each media data stream to one of the media packet access bearers used to transport a corresponding one of the media data streams between the mobile terminal and the access point. The media binding information may be used in a variety of ways to set up and control the multimedia session and the media packet access bearers.
