Abstract (en)
The file has a rear cover and a front cover and is provided with a clamping mechanism to hold paper in the file. The clamping mechanism includes two pivotally mounted gripper elements (20, 21) each spring-biased (28) into the gripping position and each being movable against the spring-bias to release position. Each gripping element has a gripper leg (26) extending above a co-operating surface (9) so that paper may be gripped between the gripper leg and the co-operating surface. Each gripper element has an actuating arm (22) so that a manual force applied to the actuating arm will move the gripper leg at the release position. A "bridge" element (32) may cover the two actuating arms so that the depression of the central part of the bridge will move the clamping mechanism to the release condition. <IMAGE>
