Abstract (en)  
[origin: WO0232782A1] The invention relates to a container (1) with an opening enclosed by a substantially flat edge (2), wherein a cover sealing the opening is adhered to the edge wherein the cover is provided with a pull-tab (4) extending outside the edge, and wherein the cover is manufactured from a flexible, tearable material, wherein the pull line (6), which extends between the distal end of the pull-tab and the middle of that part of the edge adjacent to the pull-tab, extends at a distance from the centre of gravity of the opening. Because the pull line extends in a different direction, the user will tend to grasp the container in a different direction and then pull in a different, nonradial direction. A blind channel extending from the content of the container is preferably recessed between the cover and the continuation of the edge, wherein the tear caused when the pull-tab is pulled intersects the channel.
