Abstract (en)
[origin: WO0237038A1] This invention is related to a defrosting method for a refrigeration appliance having multiple refrigeration compartments, specifically a fresh food compartment (18) and a freezer compartment (17), which comprises a fresh food evaporator (20) for cooling the fresh food compartment (18) and a freezer evaporator (6) for cooling the freezer compartment (17). The fresh food evaporator (20) is composed of two separate evaporators namely a first sub-evaporator (10) and a second sub-evaporator (11). Sub-evaporators (10 and 11) are arranged in parallel and both of the sub-evaporators (10 and 11) are used sequentially for cooling the fresh-food compartment (18). During the defrosting (10 or 11) and this enables continuous cooling of the fresh food compartment (18) and defrosting of the fresh food evaporator (20) concurrently.
