Abstract (en)

[origin: EP1334941A1] The brake holder support (17) in a weft feeder is rigidly coupled to a slider (18), which is supported, so that it can perform a rectilinear motion, by a stationary arm (19) and is integrally provided with a female thread element (22) in which a screw for adjusting the movements of the slider is engaged, the screw being constituted by the end portion (23a) of a pivot (23), which is supported so that it can rotate and perform an axial translational motion in a bushing (25) rigidly coupled to the stationary arm (19). The device includes a slack-adjustment member (26), which can perform a radial translational motion with respect to the pivot (23) and has an end portion that can be inserted in a retention groove (21) formed on the pivot, the end portion and/or the retention groove having a substantially trapezoidal cross section. <IMAGE>
